
2018-2019 Community Influenza Surveillance Report Update of Current Status February 6th, 2019

Overall Assessment

Influenza continues to circulate in the Middlesex-London region, with cases being reported across London and Middlesex County.

Analysis and Action

The Middlesex-London region, and Ontario in general, are now several weeks into the influenza season. The Health Unit encourages local residents who have not yet received their seasonal influenza vaccine to do so as soon as possible, as it takes about two weeks for the vaccine to provide optimal protection against the flu.

Regardless of the level of local influenza activity, there are a number of easy-to-follow steps that residents can take to avoid becoming sick throughout the year. While washing your hands with soap and warm water, or using an alcohol-based hand sanitizer, remain effective ways of preventing many illnesses, including influenza, local residents should also cover their coughs and sneezes, clean and disinfect high-touch surfaces frequently, and stay home when they feel sick.

Details of Current Local Activity

Between January 27th and February 2nd, there were 29 laboratory-confirmed cases of influenza A reported to the Health Unit, 14 of whom were hospitalized. As well, the Health Unit was notified last week of the death of a case who had been reported previously.

Appendix A provides additional details about laboratory-based influenza activity indicators for the current reporting week, as well as other local indicators of respiratory illness. A graph showing all 147 laboratory-confirmed cases by week of illness onset is provided at the end of this report in Appendix B.

Provincial and National Comparison

In this week's *Ontario Respiratory Pathogen Bulletin*, Public Health Ontario states that influenza activity across the province was lower when compared to what had been reported the previous week. Influenza A activity across Ontario is moderate, while influenza B activity remains low. Among the influenza A specimens that have been subtyped this season, 78.7% have been the A(H1N1)pdm09 strain.

This week's *FluWatch*, from the Public Health Agency of Canada, reports that to date this season, the most common influenza virus identified is influenza A, with 93% of subtyped specimens being the A(H1N1)pdm09 strain. The majority (86%) of influenza A(H1N1)pdm09 cases have been among those under the age of 65 years, while 62% of all influenza A(H3N2) cases have been among those 65 years of age and over.

Appendix A

Summary of Community Influenza Surveillance Indicators for Middlesex-London January 27th to February 2nd, 2019

Table 1: Summary of laboratory-based influenza activity indicators, Middlesex-London and Ontario, 2018-2019 influenza surveillance season

Indicator	Reporting Period	Number Reported: <i>Current Reporting Period</i>	Number Reported: <i>Year to Date (from September 1, 2018)</i>	Recent Trends
Laboratory-confirmed cases^{1,4}	Jan. 27-Feb. 2 (week 5) ²	Influenza A – 29 cases Influenza B – 0 cases	Influenza A – 147 cases Influenza B – 0 cases	Influenza A: Higher than the previous week (Jan. 20-26) when 26 cases were reported. Influenza B: Same as the previous week (Jan. 20-26) when no cases were reported.
Influenza sub-types¹	Jan. 27-Feb. 2	Influenza A (H3) – 0 cases Influenza A (H1N1)pdm09 – 0 cases Influenza A not yet subtyped – 29 cases	Influenza A (H3) – 6 cases Influenza A (H1N1)pdm09 – 24 cases Influenza A not yet subtyped – 117 cases	
Hospitalizations^{1,5}	Jan. 27-Feb. 2	14	65	Higher than the previous week (Jan. 20-26) when ten hospitalizations were reported.
Deaths^{1,5}	Jan. 27-Feb. 2	1	4	Higher than the previous week (Jan. 20-26) when no deaths were reported.
Influenza outbreaks in long-term care homes/retirement homes/acute care	Jan. 27-Feb. 2	Influenza A – 0 outbreaks Influenza B – 0 outbreaks	Influenza A – 5 outbreaks Influenza B – 0 outbreaks	Influenza A: Lower than the previous week (Jan. 20-26) when one outbreak was reported. Influenza B: Same as the previous week (Jan. 20-26) when no outbreaks were reported.
Percentage of samples that are positive for influenza (Ontario)³	Jan. 20-26 (week 4) ²	Influenza A – 16.4% positivity Influenza B – 0.3% positivity	N/A	Influenza A: Lower than 17.3% positivity reported the previous week (Jan. 13-19). Influenza B: Same as 0.3% positivity reported the previous week (Jan. 13-19).

Notes:

1 Numbers are subject to change week by week due to the retrospective nature of reporting.

2 Weekly influenza monitoring often uses numbered weeks from 1 to 52 weeks per year. A reference week calendar can be found at <https://www.canada.ca/en/public-health/services/diseases/flu-influenza/influenza-surveillance/fluwatch-weeks-calendar.html>

3 Public Health Ontario, Ontario Respiratory Pathogen Bulletin 2018-2019

4 The week cases are reported to the Health Unit may not be the same as week of illness onset.

5 The week hospitalizations and deaths are reported to the Health Unit may not be the same as the week in which they occurred, or the same as the week of illness onset.

Table 2: Summary of community-based respiratory illness indicators, Middlesex-London, 2018-2019 influenza surveillance season

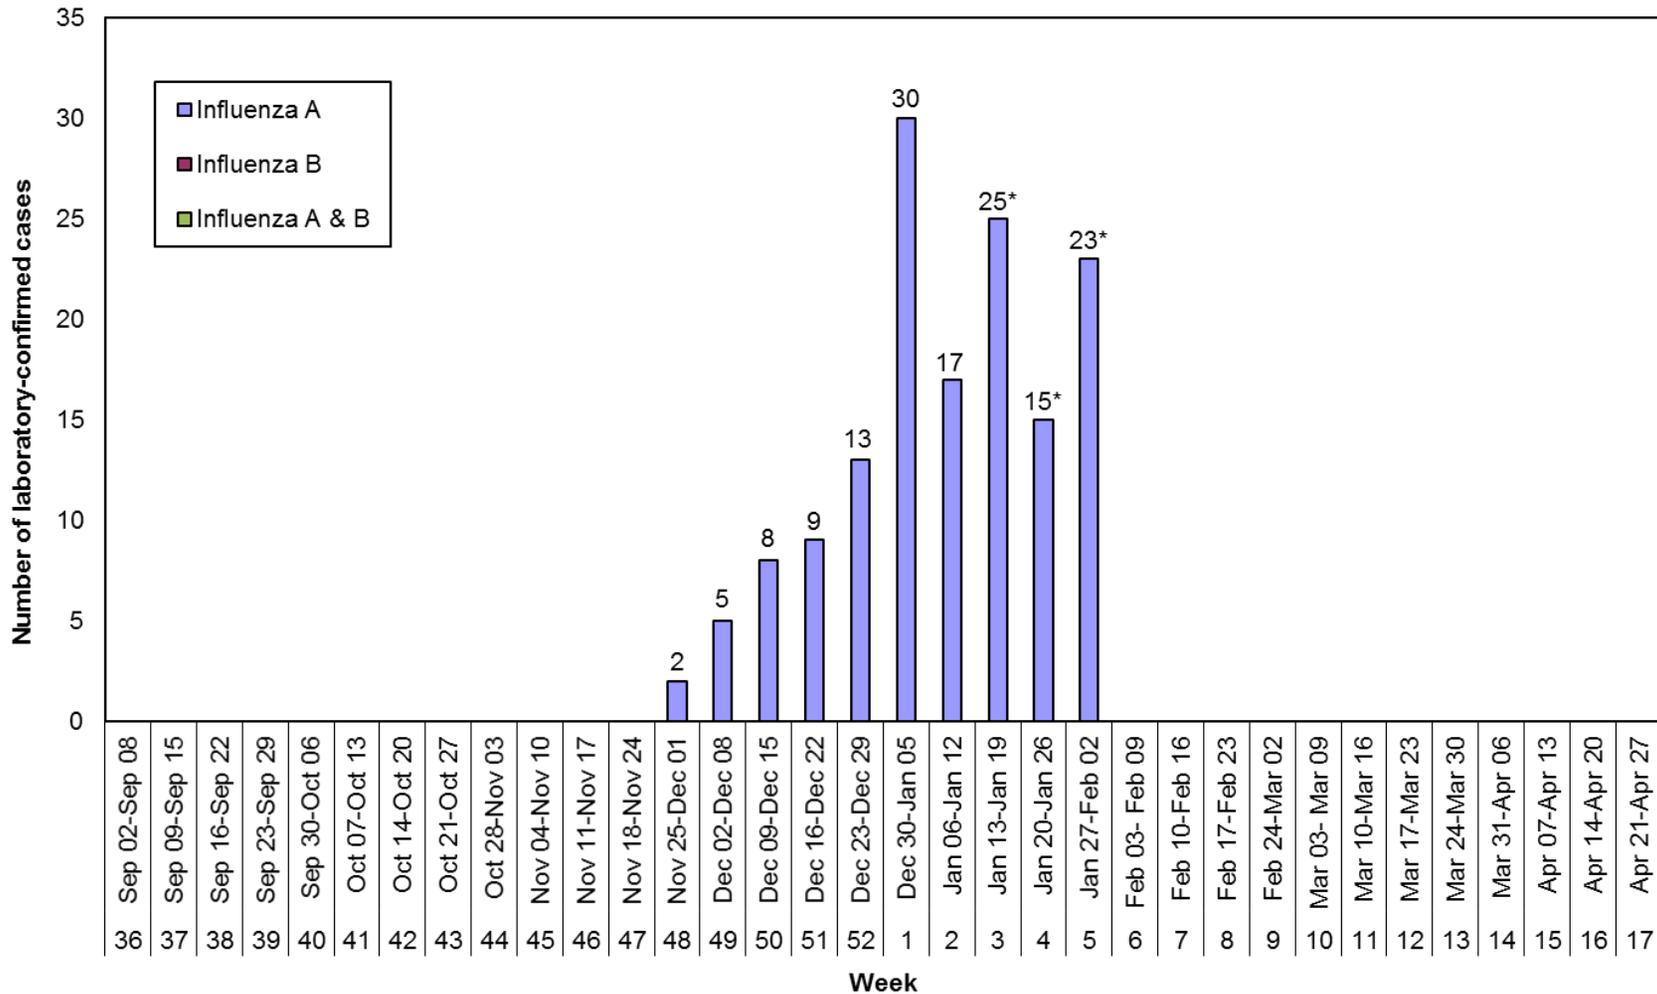

Indicator	Reporting Period	Number Reported: <i>Current Reporting Period</i>	Recent Trends
Hospital emergency room reports regarding the percentage of patients with fever and respiratory illness	Jan. 27-Feb. 2	An average of 12.9% of patients presented with fever and respiratory symptoms. The proportion was highest at the pediatric emergency department, where 35.8% of patients presented with a fever and respiratory symptoms.	Higher than 10.5% reported the previous week (Jan. 20-26). Higher than 31.1% reported the previous week (Jan. 20-26).
Absence reports from elementary schools (i.e., absenteeism > 10%)	Jan. 28-Feb. 1	Data not reported due to weather-related bus cancellations influencing absenteeism.
