## Acknowledgements

The authors would like to acknowledge Ms. Bernadette McCall, Public Health Nurse / Coordinator Healthy Living Partnership Middlesex-London and Ms. Mary Lou Albanese, Manager of Chronic Disease and Injury Prevention Services, Middlesex-London Health Unit (MLHU), for providing critical reviews of the report. Thanks to Mr. Bernie Leuske, Data Analyst, REED Services, MLHU, for assistance with data management and analysis. Also thanks to Ms. Nancy Forbes, Administrative Assistant to the Director, REED Services, MLHU, for her expertise in formatting and proofing the report.

## Introduction

## Purpose of Report

In 1998, the Good Hearted Living Program of the Middlesex-London Heart Health Program was established. It is now known as Healthy Living Partnership Middlesex-London and is dedicated to providing resources to help residents of Middlesex-London achieve a healthier lifestyle. More specifically, it encourages our community to improve their cardiovascular health by:

- getting active,
- eating healthy, and
- being smoke-free.

How much progress are we making? Are there areas which require more public health action than others? These are questions that can be answered by monitoring and evaluating related health risk factors and outcomes. This practice is referred to as public health surveillance and involves the ongoing systematic collection, analysis, interpretation, and dissemination of health data.

This report provides an analysis of current local data on cardiovascular risk factor behaviours and knowledge resulting from public health surveillance. This information is integral to planning health programs within the mandate of Healthy Living Partnership Middlesex-London. It is also a follow-up to the Middlesex-London Health Unit (MLHU) report published in 2003 entitled Cardiovascular Disease Risk Factors: A Community Health Status Report for Middlesex-London, which presented data from 2001 and 2002.

The current report presents data collected mostly from 2001 to 2007 for Middlesex County including the City of London. It enables us to assess how much progress we have made over time and compared to established targets, in adopting healthy risk factor behaviours, such as getting active, eating healthy, and being smoke-free, and thereby lowering our risk of cardiovascular disease.

## Report Structure and Data Analysis

The report is organized according to the following seven areas of focus:

- Cardiovascular Risk Factors Awareness
- Adult Smoking
- Youth Smoking and Access To Tobacco By Minors
- Smoke-Free Places
- Physical Activity
- Healthy Eating
- Healthy Weights.

Each chapter includes a summary of the main findings followed by a review of chapter-related indicators, each analyzed by age group, sex and education level, where possible. Household income level was not included in the analysis due to the significant proportion of survey respondents who did not report this information. The end of each chapter provides specific information related to the data presented and its analysis. Definitions such as the exact wording of a survey question from which an indicator was developed are also provided here.

The main data source used in the analysis of statistics presented in this report is the MLHU component of the Rapid Risk Factor Surveillance System (RRFSS). Other data presented were from the Youth Smoking Survey component of the Canadian Tobacco Use Monitoring Survey (CTUMS) and the Canadian Community Health Survey (CCHS). Data sources are described in Appendix A. The representativeness of the RRFSS sample was assessed by comparing Census data for Middlesex-London from 2001 and 2006 with RRFSS samples (see Appendix B). Detailed data tables including counts, percentages, $95 \%$ confidence intervals and sample sizes are provided for each indicator in Appendices C1 to C7. More information on analysis is provided in Appendix B.

The objectives evaluated in the report are presented below and include those established in 1998 by Healthy Living Partnership Middlesex-London and those stipulated by the Ontario Ministry of Health in the Ontario Mandatory Health Programs and Services Guidelines, 1997.

## Local Heart Health Behavioural Objectives

By March 2003:

- Fewer than 31\% of males over 15 will be smokers.
- Fewer than $23 \%$ percent of females over 15 will be smokers.
- Fewer than $16 \%$ of youth (12-19) will be smokers.
- Fewer than $30 \%$ of adult males will be overweight.
- Fewer than $23 \%$ of adult females will be overweight.
- At least $53 \%$ of males over 15 will exercise regularly.
- At least $48 \%$ of females over 15 will exercise regularly.
- At least $59 \%$ of youth will participate in daily physical activity.

## Local Heart Health Knowledge-based Objectives

By March 2003 there will be an:

- Increased awareness of Eat Smart! Restaurant Program.
- Increased awareness and knowledge of risk factors for heart disease among residents.
- Increased number of residents aware of area walking trails and bicycle paths.

## Ontario Mandatory Health Programs and Services Guidelines Objectives

- Reduce the proportion of 12-19 year olds who smoke daily to $10 \%$ by the year 2005 .
- Reduce the proportion of adults who smoke daily to $15 \%$ by the year 2005
- Increase the proportion of smoke-free homes by the year 2010.
- Increase to $75 \%$, the proportion of the population age four and older consuming $5+$ servings of vegetables and fruit daily by the year 2010.
- Slow the decrease in the proportion of adults ages 20-64 with healthy weight status by the year 2010

## Chapter 1: Awareness of Risk Factors for H eart Disease

## Key Findings

- More than three-quarters of respondents were able to identify at least one of smoking, unhealthy eating, or lack of exercise as a risk factor for heart disease.
- Unhealthy eating was the most commonly identified risk factor, chosen by over $60 \%$ of respondents between 2001 and 2006.
- The proportion of residents who identified smoking as a risk factor for heart disease declined by $26 \%$ between 2001 and 2006 ( $50 \%$ to $37 \%$, respectively).
- The 18-24 year age group had the highest level of awareness that smoking is a risk factor for heart disease at $50 \%$ in 2006. It is also the only age group whose awareness of smoking did not decline from 2001 to 2006. Likewise, this age group experienced the most dramatic decline in smoking rates (see Chapter 2).
- Just over one-third of males and females were able to identify lack of exercise as a risk factor for heart disease.
- Seniors ages 65+ was the only age group in which awareness of lack of exercise as a risk factor increased (19.3\% in 2001 to $34.4 \%$ in 2006).

## Progress on Meeting Public Health Objectives

Objective: Increased awareness and knowledge of risk factors for heart disease among residents.

## $\boxed{x}$ Work needed

- The proportion of residents able to identify at least 1 of 3 risk factors for heart disease (unhealthy eating, lack of exercise or smoking) has not changed appreciably, with $77.2 \%( \pm 2.0 \%)$ in 2001 and $78.0 \%$ $( \pm 2.9 \%)$ in 2006.
- Levels of awareness of individual risk factors (smoking, lack of exercise, unhealthy eating) did not improve from 2001 to 2006. The only exception was for the 65+ age group whose awareness level of lack of exercise increased over time.

## Background

The objectives of the Healthy Living Partnership Middlesex-London included raising awareness of modifiable risk factors for heart disease in the population. Three important modifiable risk factors for heart disease are smoking, physical inactivity, and unhealthy eating1. Population level knowledge of these risk factors was determined among adult residents of Middlesex-London between 2001 and 2006.

## Results

## Overall Awareness

The percentage of respondents able to identify at least one of smoking, unhealthy eating, or lack of exercise as a risk factor for heart disease did not change significantly between 2001 and 2006. The percentage identifying at least one of these risk factors was $77.2 \%( \pm 2.4 \%)$ in 2001 and $78.0 \%( \pm 2.9 \%)$ in 2006. The percentage who identified smoking declined significantly from $49.4 \%( \pm 3.0 \%$ ) in 2001 to $36.6 \%( \pm 3.5 \%)$ in 2006 (Figure 1.1). Unhealthy eating was the most commonly identified risk factor, chosen by over $60 \%$ of respondents in each year of data collection.

| - - Smoking | 49.4 | 44.3 | 36.6 |

Original Data Source: MLHU RRFSS 2001, 2002, 2006

## Smoking

Identification of smoking as a risk factor for heart disease declined significantly among both males and females between 2001 and 2006 (Figure 1.2). Among males, the percentage decreased from $53.0 \%$ ( $\pm 4.3 \%$ ) to $36.7 \%$ $(+5.5 \%)$. Among females, the percentage decreased from $46.2 \%( \pm 4.1 \%)$ to $36.5 \%( \pm 4.6 \%)$. Between 2001 and 2006, the percentage that identified smoking as a risk factor declined significantly among those aged 25 to 64 (Figure 1.3).

Respondents who were 65+ were significantly more likely to identify smoking as a risk factor compared to those aged 18 to 24 in both 2001 and 2006.

The percentage identifying smoking as a risk factor declined in different age groups among males and females between 2001 and 2006. A significant decline occurred among males aged 35+ and among females aged 18 to 35 (Table 1.1).

Between 2001 and 2006, the percentage of respondents identifying smoking as a risk factor for heart disease declined slightly across all levels of education, although no differences were statistically significant. Those with higher levels of education tended to identify smoking as a risk factor more frequently.

## Unhealthy Eating

The percentage of respondents identifying unhealthy eating as a risk factor did not differ between males or females. In 2001 and 2002, respondents aged 65+ were less likely to identify unhealthy eating as a risk factor compared to those aged 25 to 44 and 45 to 64 ; however, these differences were not statistically significant in 2006 (Figure 1.4). In 2001, young males (aged 18 to 34) appeared more likely to identify unhealthy eating as a risk factor than their older counterparts and women, although no differences were statistically significant (Table 1.2). The percentage of respondents identifying unhealthy eating appeared to increase the most among young women (aged 18 to 34 ), from $60.9 \%( \pm 7.5 \%)$ in 2001 to $69.4 \%( \pm 8.7 \%)$ in 2006 (Table 1.2). In 2001, the percentage of respondents identifying unhealthy eating as a risk factor increased significantly with level of completed education; however, these differences disappeared by 2006.

Original Data Source: MLHU RRFSS 2001, 2006

## Lack of Exercise

Males and females were equally likely to identify lack of exercise as a risk factor for cardiovascular disease. In 2006, lack of exercise was identified as a risk factor by $35.0 \%( \pm 5.4 \%)$ of males and $33.9 \%( \pm 4.5 \%)$ of females. In 2001, the percentage who identified lack of exercise was significantly lower among those aged 65+ (19.3\% $\pm 6.7 \%$ ) compared to the other age groups; however, this difference disappeared by 2006 (Figure 1.5). Respondents with a post-secondary education were significantly more likely to identify lack of exercise as a risk factor compared to those with less than high school at all time-points (Figure 1.6).

Figure 1.5: Percent Identifying Lack of Exercise as a Risk Factor For Heart Disease across Age Group

Original Data Source: MLHU RRFSS 2001, 2002, 2006

## Data and Methods

Data related to heart disease risk factor awareness is from RRFSS 2001 to 2002 (waves 1-24) and May to December 2006 (waves 65-72). For each year of data collection, the unweighted sample size of respondents from Middlesex-London is shown in Table 1.3. Non-responses to individual questions were included in the calculation of the proportion of respondents who did not select the given risk factor. The sample was weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars showing 95\% confidence intervals. Detailed tables for Chapter 1 are located in Appendix C.1.

Table 1.3. Unweighted Sample Size for RRFSS Data on Heart Disease Risk Factor Awareness Adults 18+, Middlesex-London, 2001-2002; 2006

| Year | 2001 | 2002 | 2006 |
| :--- | :---: | :---: | :---: |
| Sample size | 1078 | 1139 | 739 |

Original Data Source: MLHU RRFSS 2001, 2002, 2006

## Definitions

## Awareness of risk factors for heart disease:

Question: "In your opinion, what are the main causes of heart disease?"

- Options were not read to respondents
- More than one response was allowed
- Smoking as a risk factor for heart disease included smoking or tobacco.
- Unhealthy eating as a risk factor for heart disease included poor diet (not eating properly, overeating, and poor choice of food) as well as eating too many fatty foods and foods high in cholesterol.

## Highest level of Completed Education

Question: "What is the highest level of education you have obtained?"

- Less than high school: included those respondents who had not obtained a high school diploma.
- High school: included those respondents who had obtained a high school diploma or had completed some post-secondary education.
- Post secondary: included those respondents who had obtained a college diploma or university degree.

## Chapter 2: Adult Smoking Status

## Key Findings

- The proportion of current smokers declined by $20 \%$ from $25 \%$ in 2001 to $20 \%$ in 2007.
- The greatest decline was observed in the age group 18 to 24 years. This same age group also had the highest awareness of smoking as a heart disease risk factor which did not decline over time, unlike the other age groups (see Chapter 1).
- A greater proportion of males were current smokers than females in 2001; however, a greater decline in smoking was observed in males compared to females from 2001 to 2007.
- The proportion of current smokers decreased with increasing level of education, and this trend remained relatively constant between 2001 and 2007.
- Nearly three-quarters of current smokers indicated they would like to quit smoking in the future. There were no significant changes between 2001 and 2007.

## Progress on Meeting Public Health Objectives

Objective: Fewer than 31\% of males over 15 years will be smokers by March 2003.

## $\checkmark$ Assessment: Achieved*

The proportion of male smokers (age 18+) decreased to $20.6 \%( \pm 3.5 \%)$ in 2007 from $27.4 \%( \pm 3.5 \%)$ in 2001. Objective: Fewer than 23\% of females over 15 years will be smokers by March 2003.
$\checkmark$ Assessment: Achieved*
The proportion of female smokers (age 18+) decreased to $19.1 \%( \pm 3.0 \%)$ in 2007 from $21.7 \%( \pm 3.2 \%)$ in 2001. Objective: Reduce the proportion of adults who smoke daily to $15 \%$ in the year 2005 .

## $\rightarrow$ Assessment: Progress

The proportion of daily smokers (adults $18+$ ) decreased to $16.1 \%( \pm 2.1 \%)$ in 2007 from $19.9 \%( \pm 1.7 \%)$ in 2001.
*Note: RRFSS data does not include participants younger than 18 years; thus, a direct evaluation of local objectives cannot be made.

## Background

Cigarette smoking is a major cause of cardiovascular disease ${ }^{2}$ and the number one preventable cause of death and disease in Canada ${ }^{3}$. In 1996, smoking was responsible for 45,200 deaths in Canada, of which 17,703 (39\%) were from cardiovascular disease ${ }^{3}$. Between 1991 and 1996, the number of smoking-attributable deaths in Canada increased by $8 \%{ }^{3}$. A $1 \%$ decline in the prevalence of smoking would save Canada more than 50 million dollars in health care costs ${ }^{4}$.

In Ontario, smoking is estimated to cause 12,000 deaths each year ${ }^{5}$. The province of Ontario set objectives to reduce the proportion of adults who smoke daily to $15 \%$ by the year $2005^{6}$. One of the objectives of the Healthy Living Partnership Middlesex-London was to reduce the number of smokers among male and female adults to $31 \%$ and $23 \%$, respectively.

Smoking cessation is difficult to achieve. In 2004, 17\% of Canadian smokers contemplated quitting, and 9\% prepared themselves to quit; however, only $2 \%$ took action to quit ${ }^{5}$.

## Results

Smoking status among adult residents of Middlesex-London between 2001 and 2007 is shown in Figure 2.1. The proportion of residents who reported never smoking increased slightly from $47.0 \%$ ( $\pm 2.8 \%$ ) to $50.0 \%( \pm 2.8 \%)$ between 2001 and 2007. During this time, the proportion of respondents defined as former smokers also increased slightly from $28.5 \%( \pm 2.5 \%)$ to $30.2 \%( \pm 2.6 \%)$.

The proportion of Middlesex-London residents that smoked daily or occasionally between 2001 and 2007 is shown in Figure 2.2. The proportion of current smokers, defined as daily or occasional smokers decreased from $24.5 \%( \pm 2.4 \%)$ in 2001 to $19.8 \%( \pm 2.3 \%)$ in 2007.

## Sociodemographics

In 2001, significantly more males were current smokers than females; however, a greater decline in smoking was observed among males compared to females (Figure 2.3). The proportion of current smokers among males decreased from $27.4 \%( \pm 3.6 \%)$ in 2001 to $20.6 \%( \pm 3.5 \%)$ in 2007; this difference, however, was not statistically significant. In contrast, the proportion of current smokers among females only decreased from $21.7 \%( \pm 3.2 \%)$ in 2001 to $19.1 \%( \pm 3.0 \%)$ in 2007.

While the proportion of current smokers was highest among those aged 18 to 24 in 2001 ( $32.0 \% \pm 6.4 \%$ ), in 2007 the highest proportion of current smokers was observed among those aged 25 to 34 ( $27.9 \% \pm 6.4 \%$ (Table 2.1). Respondents aged 65+ were the least likely to be current smokers: $10.4 \%( \pm 9.7)$ in 2001 and $9.7 \%( \pm 4.1 \%)$ in 2007.

From 2001 to 2007, the proportion of current smokers among those aged 18 to 24 decreased significantly from $32.0 \%( \pm 6.4 \%)$ to $17.0 \%( \pm 7.6 \%)$ (Figure 2.4). In the other age categories, current smoking status appeared to decrease only slightly.

The proportion of current smokers was significantly lower among those with higher levels of education. An inverse relationship was consistently observed across the years 2001 to 2007 (Figure 2.5). In 2007, the proportion of current smokers among post-secondary graduates was $14.6 \%( \pm 2.8 \%)$ compared to $27.8 \%( \pm 8.2 \%)$ among those with less than a high school education.

## Plans for Smoking Cessation

Nearly three-quarters of current smokers indicated they would like to quit smoking in the future. This number did not change significantly between 2001 and 2007 (Figure 2.6). In 2007, 15.3\% ( $\pm 4.6 \%$ ) of current smokers indicated they were committed to quitting in the next 30 days; an additional $52.5 \%( \pm 6.4 \%)$ reported they were considering quitting at some point in the future. There was a non-significant trend towards younger age-groups expressing greater desire for quitting smoking; however, rates were unstable due to small sizes and are not reported here. Plans for smoking cessation did not differ significantly by sex or level of education.

Original Data Source: MLHU RRFSS 2001-2004; 2006-2007

## Data and Methods

Questions related to smoking status were included in all waves between 2001 and 2007 (waves 1 to 84). Questions related to smoking cessation were included in all waves between 2001 and 2004 and May 2006 to December 2007 (waves 1 to 48 and 65 to 84). For each year of data collection, the unweighted sample of respondents from Middlesex-London is shown in Table 2.2. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents. The sample was weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars illustrating $95 \%$ confidence intervals. Detailed tables for Chapter 2 are located in Appendix C2.

Table 2.2. Unweighted Sample Size for RRFSS Data on Smoking Behaviour Adults 18+, Middlesex-London, 2001-2007

Original Data Source: MLHU RRFSS 2001-2004; 2006-2007

## Definitions

Smoking status was determined from the response to the following questions: "Have you smoked at least 100 cigarettes in your life?" Respondents who answered yes were then asked "Currently do you smoke cigarettes everyday, some days, or not at all?"

Never smokers: Respondents who were not smoking at the time of the interview and answered "no" to the question "Have you smoked at least 100 cigarettes in your life?"

Former smokers: Respondents who were not smoking at the time of the interview, but answered "yes" to the question "Have you smoked at least 100 cigarettes in your life?"

Occasional smokers: Respondents who reported smoking some days, but not every day.
Daily smokers: Respondents who reported smoking everyday.
Current smokers: Respondents who were daily or occasional smokers.
Smoking Cessation: Respondents who were daily or occasional smokers were asked how they felt about quitting smoking. Response options included: 1) Currently not thinking of smoking, 2) Not thinking of quitting, 3) Considering quitting in the next six months, or 4) Committed to quit smoking in the next 30 days. For cross tabulations with sociodemographic variables, participants were defined as 'planning smoking cessation' if they were considering quitting or were committed to quitting in the next 30 days.

## Highest level of Completed Education

Question: "What is the highest level of education you have obtained?"

- Less than high school: included those respondents who had not obtained a high school diploma.
- High school: included those respondents who had obtained a high school diploma or had completed some post-secondary education.
- Post secondary: included those respondents who had obtained a college diploma or university degree.

## Chapter 3: Youth Smoking

## Key Findings

- About $15 \%$ of youth ( 12 to 19 years) in the Middlesex-London area were current smokers in 2003.
- The proportion of current smokers among Ontario youth aged 15 to 24 decreased markedly between 1999 and 2006.
- Current smokers among males decreased from 32\% to $23 \%$.
- Current smokers among females decreased from $27 \%$ to $14 \%$.
- Males were $65 \%$ more likely to be current smokers than females.
- The proportion of Middlesex-London adults asked by minors to provide or purchase cigarettes declined significantly between 2001 and 2007, from 16\% to 6\%.
- The proportion of Middlesex-London adults asked by minors to provide or purchase cigarettes was significantly greater among smokers than non-smokers; however, the proportions fell significantly in both groups between 2001 to 2007.

## Progress on Meeting Public Health Objectives

Local Objective: Less than $16 \%$ of youth age 12 to 19 will be smokers by March 2003.
It is possible that the objective was met in 2003 with a rate of $15.9 \%$ ( $\underline{6} 6.3$ ). However, 2003 data was considered unstable*, there are no more recent data available to assess such change, and estimates from 2000 and 2003, although not highly stable, suggest that the proportion may have increased from $14.2 \%$ ( $\pm 2.7 \%$ ) in 2000 to $15.9 \% ~(~+6.3 \%)$ in 2003.
Provincial Objective: Reduce the proportion of 12 to 19 year olds who smoke daily to $10 \%$ in the year 2005.
Data was not available to assess whether the objective was met in 2005. It is possible that it was met in 2003 at $10.1 \%$ ( $\pm 5.4 \%$ ). This estimate, however, is considered unstable*, there are no further data to assess change, and estimates from 2000 and 2003, although not highly stable, suggest the proportion may have risen from $9.2 \%( \pm 4.8 \%)$ in 2000/2001 to $10.1 \%(+5.4 \%)$ in 2003.

* Unstable estimates are usually due to small sample sizes

## Background

In Canada, a person must be 18 years of age or older to legally purchase tobacco products; in Ontario, the legal age is 197 . Despite this preventive measure, rates of tobacco use remain high among Canadian youth. According to the Canadian Tobacco Use Monitoring Survey (CTUMS), the proportion of current smokers among Canadian youth aged 15 and older was $19 \%$ in $2005^{8}$. In the 2006-2007 CTUMS, the proportion of Ontario youth who had ever tried smoking was $13 \%$ among youth in grades 5 to 9 , and $42.7 \%$ among youth in grades 10 to $12^{2}$.

Smoking habits typically begin during the adolescent years and earlier initiation is associated with heavier smoking and earlier onset of adverse health outcomes ${ }^{9}$. In Canada, the majority of current smokers in grades 5 to 12 obtain cigarettes from social sources ${ }^{8}$.

## Results:

The percentage of youth who have never smoked rose from $69 \%$ in 2000 to $82 \%$ in 2005 (Figure 3.1). This increase, however, is not statistically significant. Between 2000 and 2003, the proportion of current smokers among youth aged 12 to 19 years in the Middlesex-London area appear to have increased slightly from $14.2 \%$ $( \pm 6.1 \%)$ to $15.9 \%( \pm 6.3 \%)$ (Figure 3.1). This difference is not statistically significant, however, and estimates for current smokers should be interpreted with caution. The proportion of current smokers did not differ between males and females during this time period.

The proportion of daily smokers among youth aged 12 to 19 years in the Middlesex-London area did not change significantly with $9.2 \%( \pm 4.8 \%)$ in $2000 / 2001$ and $10.1 \%( \pm 5.4 \%)$ in 2003 . These rates are moderately variable and should be interpreted with caution. Rates for 2005 were too unreliable to report.

Middlesex-London, 2000/2001, 2003, 2005

Original Data Source: CCHS 2000/2001; 2005; 2007

## Youth Smoking in Ontario

The prevalence of youth smoking in Ontario decreased markedly between 1999 and 2006 among both males and females (Figure 3.2). During this time, the proportion of current smokers among males aged 15 to 24 decreased from $32 \%$ to $23.1 \%$. Similarly, the proportion of current smokers among females aged 15 to 24 decreased from $27 \%$ to $14.0 \%$. In 2006, males were $65 \%$ more likely to be smokers than females; a notable increase from 1999.

Figure 3.2: Current Smoking Status Among Young Adults in Ontario
Youth (15-24 years), Ontario 1999-2006

Original Data Source: CTUMS 1999-2006

## Access to Tobacco by Minors

The proportion of adults (ages 19+) in Middlesex-London asked by minors to provide or purchase cigarettes declined significantly between 2001 and 2007 (Figure 3.3). Of the respondents asked to purchase cigarettes for minors, the proportion who agreed to the request increased slightly between 2001 and 2005 (Table 3.1). Compared to non-smokers, current smokers were significantly more likely to be asked by minors to provide (Figure 3.4) or purchase (Figure 3.5) cigarettes; however, in both cases the proportions decreased significantly between 2001 and 2007.

Figure 3.3: Proportion of Adults asked by Minors to Provide or Purchase Cigarettes Adults 18+, Middlesex-London, 2001-2007

Original Data Source: MLHU RRFSS 2001, 2005, 2007

Original Data Source: MLHU RRFSS 2001; 2005; 2007

## Data and Methods

Youth smoking rates for Ontario were obtained from the Youth Smoking Survey collected as part of the Canadian Tobacco Use Monitoring Survey (CTUMS) ${ }^{8}$. More information on CTUMS is provided in Appendix A.

Data on requests by minors to provide or purchase cigarettes were collected by RRFSS in 2001, 2005, and from September to December in 2007 (waves 1 to $12 ; 49$ to 60 ; and 81 to 84, respectively). Questions on whether respondents provided or purchased cigarettes to/for minors were only asked in 2001 and 2005. For each year of data collection, the unweighted sample of respondents from Middlesex-London is shown in Table 3.2. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents. The sample was weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars showing 95\% confidence intervals. Detailed tables for Chapter 3 are located in Appendix C3.

Original Data Source: MLHU RRFSS 2001; 2005; 2007

## Definitions:

Current Smoker: Smoked at least 100 cigarettes in his/her lifetime and smoked at least 1 cigarette during the 30 days preceding the interview.
Former Smoker: Did not smoke at the time of the interview, but answered 'Yes' to the question "Have you smoked at least 100 cigarettes in your life?"
Never smokers: Did not smoke at the time of the interview, and answered "No" to the question "Have you smoked at least 100 cigarettes in your life?"

Non-smokers: Respondents who were not current smokers.

## Accessing Tobacco among Minors

Question: "In the last six months, has a young person, under 19 years of age, asked you to GIVE them cigarettes?"
Question: Did you GIVE them cigarettes?
Question: In the last six months, has a young person, under 19 years of age, asked you to BUY them cigarettes? Question: Did you BUY them cigarettes?

[^0]
## Chapter 4: Smoke-free H omes and Vehicles

## Key Findings

- The proportion of respondents living in smoke-free homes increased by $45 \%$ ( $55 \%$ in 2001 to $80 \%$ in 2007).
- The proportion of respondents who do not allow smoking in their vehicles increased by $21 \%$ ( $67 \%$ in 2001 to 81\% in 2007).
- The proportion of respondents living in smoke-free homes and driving smoke-free vehicles rose among both males and females and across all age groups from 2001 to 2007.
- The proportion of respondents living in smoke-free homes or driving smoke-free vehicles increased significantly with higher levels of education and this relationship was consistent over time.

## Progress on Meeting Public H ealth Objectives

Provincial Objective: Increase the proportion of smoke-free homes by the year 2010.

## $\checkmark$ Assessment: Achieved

The proportion of residents living in smoke-free homes increased from $55.4 \%( \pm 3.5)$ in 2001 to $80.1 \%( \pm 2.3 \%)$ in 2007.

## Background

Exposure to environmental tobacco smoke (ETS) is an important modifiable risk factor for many diseases including heart disease, respiratory problems and cancer ${ }^{10,11}$. Health Canada maintains that there is no safe exposure level of environmental tobacco smoke ${ }^{11}$. In 1997, more than 800 Canadians died of coronary heart disease caused by passive ETS exposure in 1997 ${ }^{12}$. The authors suggest this mortality figure is likely an underestimation, since it did not include the number of deaths among non-smokers exposed to ETS in the workplace.

Between 2001 and 2002, 21\% of Ontarians reported that smoking occurred inside their home occasionally, and $15 \%$ said smoking occurred daily ${ }^{13}$. Children living in homes with smokers are frequently exposed to second hand smoke: of the $55 \%$ of Ontario respondents in homes with smokers and children, $33 \%$ reported that smoking occurred inside their homes daily ${ }^{13}$.

Smoke-free environments are one way to assist smokers to quit and prevent young people from starting ${ }^{14}$. Municipal and provincial legislation in the early 1990's made all municipal buildings health care facilities, municipal arenas, theatres, movie houses and common areas of apartments $100 \%$ smoke-free public places ${ }^{15,16}$. Middlesex-London has taken a lead in creating smoke-free places. As of January 2002, all restaurants in the City of London were made $100 \%$ smoke-free as a result of provisions in the Smoking Control By-law, PH-816. In 2003, the City of London Smoke-free Public Places and Smoke-free Workplaces By-laws were mandated to designate all public places and workplaces (bars, bingo parlours, and billiard halls) as smoke-free.

The attainment of smoke-free homes and vehicles, particularly in the presence of children, is an important goal. In the province of Ontario, the Smoke Free Ontario Act went into effect on May 31, 2006. In June 2008, an amendment to the Act, Smoking in Motor Vehicles (Bill 69), was introduced and will come into effect on January 21, 2009. The amendment restricts anyone smoking or carrying lighted tobacco in a private motor vehicle while a person who is less than 16 years old is present in the vehicle and imposes fines up to $\$ 250$. It will be enforced by London Police Service and the Ontario Provincial Police. Similar legislation is found in Nova Scotia and British Columbia.

## Results

The proportion of respondents living in smoke-free homes increased significantly from $55.4 \%( \pm 3.5 \%)$ in 2001 to $80.1 \%( \pm 2.3 \%)$ in 2007 (Figure 4.1). The proportion of residents who allowed smoking in their homes except in the presence of children decreased slightly from $5.3 \%( \pm 1.6 \%)$ in 2001 to $4.6 \%( \pm 1.2 \%)$ in 2007 (Figure 4.1).

Figure 4.1: Smoking in Homes by Residents and Visitors Adults 18+, Middlesex-London, 2001-2007

Original Data Source: MLHU RRFSS 2001-2007

## Sociodemographics

Between 2001 and 2007, the proportion of residents living in smoke-free homes increased significantly among both males and females (Figure 4.2). Between 2001 and 2007, the proportion of respondents living in smoke-free homes increased significantly within all age groups (Figure 4.3).

The proportion of respondents living in smoke-free homes was significantly higher among those with higher levels of education. This relationship was consistent across the years 2001 and 2007 (Figure 4.4). In 2007, the proportion of post-secondary graduates living in smoke-free homes was $86.0 \%( \pm 2.7 \%)$ compared to $72.6 \%$ $( \pm 8.2 \%)$ among those with less than a high school education.

Significantly fewer current smokers than non-smokers lived in smoke-free homes; however, between 2001 and 2007, the proportion of smokers living in smoke-free homes more than doubled from $21.3 \%( \pm 5.9 \%)$ to $48.7 \%$ ( $+6.4 \%$ ) (Figure 4.5).

## Smoke-free Vehicles

Between 2001 and 2007, the proportion of respondents who did not allow smoking in their vehicles increased significantly from $69.0 \%( \pm 2.7 \%)$ to $81.2 \%( \pm 2.3 \%)$ (Figure 4.6). The proportion who allowed smoking in their vehicles except in the presence of children decreased slightly from $8.5 \%( \pm 1.6 \%)$ in 2001 to $7.6 \%( \pm 1.5 \%)$ in 2007 (Figure 4.6).

Figure 4.6: Smoking Allowances in Respondent's Vehicle Adults 18+, Middlesex-London, 2001-2003, 2007

Original Data Source: MLHU RRFSS 2001-2003; 2007

## Sociodemographics

Between 2001 and 2007, the proportion of residents driving smoke-free vehicles increased significantly among both males and females (Table 4.1). The likelihood of driving a smoke-free vehicle increased with age; this relationship was consistent across the years 2001 and 2007 (Figure 4.7). The proportion of respondents driving smoke-free vehicles was significantly higher among post-secondary graduates. Between 2001 and 2007, the proportion of post-secondary graduates driving smoke-free vehicles increased from $76.1 \%$ ( $\pm 3.4 \%$ ) to $85.8 \%$ $( \pm 2.7 \%)$ (Figure 4.8). Significantly fewer current smokers than non-smokers drove smoke-free vehicles; however, between 2001 and 2007, the proportion of residents driving smoke-free vehicles increased by about $9 \%$ in both current and non-smokers alike (Figure 4.9). Between 2001 and 2007, the proportion of residents who had both smoke-free homes and vehicles increased significantly from $51.1 \%( \pm 3.6 \%)$ to $74.1 \%( \pm 2.6 \%)$ (Figure 4.10).

## Data and Methods

Data on smoke-free homes were from RRFSS May to December 2001 (waves 5 to 12) and 2002 to 2007 (waves 13 to 84). Data on smoke-free vehicles were from RRFSS 2001 to 2003 and 2007 (waves 1 to 36 and 73 to 84, respectively). For each year of data collection, the unweighted samples of respondents from Middlesex-London who answered questions related to smoke-free homes and vehicles are shown in Tables 4.2 and 4.3, respectively. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents. For questions related to smoke-free homes, the sample was weighted to account for each individual's probability of being selected within households of different sizes; no weighting was used to calculate the proportion of smoke-free vehicles. Bar charts and line graphs include error bars showing $95 \%$ confidence intervals. Detailed tables for Chapter 4 are located in Appendix C4.

## Definitions

Smoke-free homes Question: "Does anyone in this household smoke regularly inside the home?" (Yes; No; Don't know; Refused)

Question: "Which best describes the rules or understandings about not smoking inside the home for visitors: would you say...not allowed at all; allowed sometimes; allowed in certain areas; allowed except in the presence of children; smokers do whatever they want; don't know; refused?"

Smoke-free vehicles Question: "Which best describes the rules or understandings about people smoking in the vehicle you drive most":

- not allowed at all; allowed sometimes; allowed in certain areas; allowed except in the presence of children; smokers do whatever they want; don't know; refused?
- Only those residents who had driven a motor vehicle in the past 12 months were included in calculating the proportion of smoke-free vehicles.

Respondents living in smoke-free homes and driving smoke-free vehicles Respondents who never allowed smoking in their home and never allowed smoking in their cars.

## Highest level of Completed Education

Question: "What is the highest level of education you have obtained?"

- Less than high school: included those who had not obtained a high school diploma.
- High school: included those who had obtained a high school diploma or had completed some post-secondary education.
- Post secondary: included those who had obtained a college diploma or university degree.

## Chapter 5: Physical Activity

## Key Findings

- The proportion of adults in Middlesex-London with a health-enhancing level of physical activity remained stable at about 60\% between 2004 and 2007.
- Males were $19 \%$ more likely to have a health-enhancing level of physical activity than females.
- In general, the likelihood of high physical activity decreased with age
- Differences between age groups were less pronounced in 2007 compared to 2004.
- Activity levels decreased with age more rapidly in males after age 35 than in females.
- More than two-thirds ( $68 \%$ ) of youth (aged 12 to 19 ) were at least moderately active during leisure time in 2007.
- Knowledge of recreational trails in Middlesex-London increased somewhat between 2001 and 2008 from 81\% to $88 \%$, respectively. Use of recreational trails, at $63 \%$ in 2008 , has not changed significantly since 2001.

## Progress on Meeting Public Health Objectives

Local Objective: At least $53 \%$ of males over 15 will exercise regularly by March 2003.

## $\checkmark$ Assessment: Achieved*

Achieved in 2004 with $64.9 \%( \pm 4.4 \%)$ of men (ages $18+$ ) who were at least moderately active; has not improved, however, as of 2007 at $64.8 \%( \pm 4.6 \%)$.

Local Objective: At least 48\% of females over 15 will exercise regularly by March 2003.

## $\checkmark$ Assessment: Achieved*

Achieved in 2004 with $56.4 \%( \pm 4.3 \%)$ of women (ages $18+$ ) who were at least moderately active; has not improved, however, as of 2007 at $54.3 \% ~( \pm 4.2 \%)$.
*Note: RRFSS data does not include participants younger than 18 years; thus, a direct evaluation of local objectives cannot be made.

Local Objective: At least 59\% of youth will participate in daily physical activity by March 2003.

## $\checkmark$ Assessment: Achieved

Achieved in 2001 with $60.9 \%( \pm 8.7 \%)$ of youth (ages 12 to 19) who were at least moderately active during leisure time; proportion has increased to $68.4 \%( \pm 11.7 \%)$ in 2007, but change is not statistically significant.
Local Objective: Increase the number of residents aware of walking trails and bicycle paths.
$\checkmark$ Assessment: Achieved
Knowledge of recreational trails in Middlesex-London increased from 80.6\% ( $\pm 2.3 \%$ ) in 2001 to $87.9 \% ~(~+3.7 \%)$ in 2008.

## Background

Physical activity has long been recognized as a strategy to help promote well being, reduce stress, achieve a healthy body weight, and prevent a number of chronic diseases including cardiovascular disease, diabetes, and cancer 1,17-19.

A number of provincial reports have emphasized the importance of physical activity, and have set specific population-level targets ${ }^{20}$. In 2004, the Chief Medical Officer of Health Report included the following recommendations with respect to physical activity ${ }^{21}$ :

- Develop policy promoting physical activity, investigate the impact of user fees on recreational facility use, and support safe active transportation options.
- Create workplace environments that help people increase physical activity at work.
- Provide daily physical activity in schools and homes.
- Encourage individuals to follow Canada's Physical Activity Guide to Healthy Active Living.

In 2005, the Ontario Ministry of Health Promotion released Active 2010: Ontario's Sport and Physical Activity Strategy ${ }^{20,22}$. A primary target of this report specified that by 2010, $55 \%$ of Ontarians will perform the equivalent of at least 30 minutes/day of physical activity.

The Ontario Heart Health Program began its second five-year phase in 200320. In this second phase, the Healthy Living Partnership transitioned from a heart health model to an integrated chronic disease prevention model, which included a broader chronic disease focus. Programs and initiatives included pedometer challenges, Healthy Active School Award, Turn Off The Screens Week, Challenge of the Heart, and the Healthy Living Campaign ${ }^{20}$.

In 1998, the Middlesex-London Health Unit in collaboration with other community partners began offering organized walks on a monthly basis ${ }^{23}$. This initiative was continued by the Thames Valley Trail Association, which has offered weekly walks since 2002. In addition, a "City of London Walking Map" has been printed and distributed since 2001. In 2002, a map of "Walking Trails of Middlesex County" was distributed. The goal for both the weekly walks and map production was to increase awareness and use of walking trails and pathways in London.

## Results

The proportion of respondents defined as having a high or health-enhancing level of physical activity ( $\geq 1$ hour/day of at least moderate-intensity activity, or 0.5 hours/day of vigorous-intensity activity) remained relatively constant, not exceeding 60\%, between 2004-2007 (Figure 5.1).

Figure 5.1: Physical Activity Level
Adults 18-69, Middlesex-London, 2004-2007

Original Data Source: MLHU RRFSS 2004-2007

## Sociodemographics

Males were more likely to have a health enhancing level of physical activity compared to females. This difference was statistically significant from 2005 to 2007 (Figure 5.2). In general, the likelihood of high physical activity decreased with age, although differences between age groups were less pronounced in 2007 compared to 2004 (Figure 5.3). Figure 5.4 shows physical activity level across age and sex averaged over the years 2004 to 2007. Although males were more physically active than females, activity levels decreased more rapidly with age in men after age 35. No significant differences were observed between high level of physical activity and education level (Table 5.1). Respondents with less than a high school education reported the highest level of physical activity in three of the four years of data collection.

Original Data Source: MLHU RRFSS 2004-2007

## Physical Activity Among Youth During Leisure Time

Over two-thirds (68\%) of youth aged 12 to 19 years in Middlesex-London were at least moderately active during their leisure time in 2007 (Figure 5.5). This represents a $12 \%$ increase from 2001 but is not statistically significant. These rates are similar to those for Ontario as a whole.

Figure 5.5: Youth Ages 12 to 19 Who Are at Least Moderately Active During Leisure Time, Middlesex-London and Ontario 2001-2007

Original Data Source: CCHS Cycles 1.1, 2.1, 3.1, 4.1

## Knowledge and Use of Recreational Trails in Middlesex-London

Knowledge of recreational trails in Middlesex-London increased somewhat from 80.6\% ( $\pm 2.3 \%$ ) in 2001 to 87.9\% $( \pm 3.7 \%)$ in 2008. Use of trails, however, remained relatively unchanged (Figure 5.6).

Figure 5.6: Knowledge and Use of Recreational Trails
Adults 18+, Middlesex-London, 2001-2003, 2008

Original Data Source: MLHU RRFSS 2001-2003, 2008

## Sociodemographics

Knowledge and use of recreational trails did not differ significantly between males and females. Knowledge and use tended to be lowest among respondents aged 65+ and greatest among those aged 25 to 44. Between 2001 and 2003, use of recreational trails was significantly lower among those aged 65+ (Figure 5.7). Knowledge and use of recreational trails increased with level of education. Use of recreational trails was significantly higher among those who had completed a post-secondary education compared to those with less than a high school education (Figure 5.8).

Figure 5.7: Use of Recreational Trails in Past 12 Months Across Age Groups
Adults 18+, Middlesex-London, 2001-2003

Figure 5.8: Use of Recreational Trails in Past 12 Months by Level of Education
Adults 18+, Middlesex-London, 2001-2003

Original Data Source: MLHU RRFSS 2001-2003

## Data and Methods

Data on physical activity among adults (age 18 to 69) was collected through RRFSS between 2004 and 2007 (waves 37-84). The RRFSS module is based on the International Physical Activity Questionnaire (IPAQ)-Short form. The IPAQ has been validated for populations aged 15 to 69 years old ${ }^{24}$, thus respondents aged 69 and older were excluded. For each year of data collection, the unweighted sample size of respondents from Middlesex-London is shown in Table 5.2. Non-responses to individual questions in the IPAQ were excluded prior to calculating proportions. The maximum allowable minutes for all walking, moderate and vigorous time variables were truncated at 240 minutes.

Data on youth (aged 12 to 19) physical activity during leisure time was obtained from the Physical Activity Index of the Canadian Community Health Survey (CCHS), 2000/2001, 2003, 2005.

Data on recreational trail use and knowledge were from RRFSS from May 2001 to May 2003 (waves 5 to 29). For each year of data collection, the unweighted sample size of respondents from Middlesex-London is shown in Table 5.3. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents.

For both physical activity and recreational trail use/knowledge, the samples were weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars illustrating 95\% confidence intervals. Detailed tables for Chapter 5 are located in Appendix C5.

| Sample size | 806 | 1209 | 439 |

Original Data Source: MLHU RRFSS 2001-2003

## Definitions

International Physical Activity Questionnaire-Short Form (IPAQ) ${ }^{24}$ : The RRFSS physical activity module was based on a short form of IPAQ, which was designed to assess physical activity across leisure time, domestic and gardening activities, work-related and active transportation. The respondent is asked to recall physical activity levels in the past 7 days. IPAQ classifications for physical activity level include high, moderate, and low (Table 5.4).

It should be noted that changes to the IPAQ classification of physical activity changed in 2005. Prior to 2005, there were four categories of activity: high, moderate, low and inactive. Moderate or higher was considered to be health enhancing physical activity (HEPA). Since the analysis for this report applied the updated classification scheme to all years (2004 to 2007), estimates for physical activity level differ from those using the older classification scheme.

CCHS Physical Activity Index: Calculated based on the type and duration of exercise, thus reflecting energy expenditure (EE).

- Physically Active: the highest activity level, those who averaged an EE of $3.0+\mathrm{kcal} / \mathrm{kg} / \mathrm{day}$.
- Moderately Active: included those who averaged an EE of 1.5 to $2.9+\mathrm{kcal} / \mathrm{kg} /$ day.
- Physically Inactive: included those with an EE below $1.5 \mathrm{kcal} / \mathrm{kg} /$ day.

Table 5.4: Definition of IPAQ Physical Activity Level

| IPAQ |  |  |
| :---: | :---: | :---: |
| Category | Description | Risk Level |

Equivalent to 12,500 steps/day, or $\geq 1$ hour/day of at least moderate intensity activity, or 0.5 hour/day of vigorous-intensity activity over and above basal levels daily.

Low risk
Meets any one of the following criteria:
High - Vigorous-intensity activity on $\geq 3$ days achieving a minimum total physical activity of at least 1500 MET*-minutes/week $^{*}$ OR

Considered to be health enhancing physical activity (HEPA)

- $\quad \geq 7$ days of any combination of walking, moderate-intensity or vigorous-intensity activities achieving a minimum total physical activity of at least $3000 \mathrm{MET}^{*}$-minutes/week.
Equivalent to 0.5 hours of at least moderate-intensity physical activity on most days accumulated in leisure and work time.

Meets any one of the following criteria:

|  | $\bullet$ | $\geq 3$ days of vigorous-intensity activity of at least 20 minutes per |
| :---: | :---: | :---: | At risk for chronic

Low - No activity is reported or some activity is reported, but not enough to meet moderate activity.

At highest risk of premature death due to cardiovascular disease
*MET = Metabolic equivalent. A MET is a measure of physical activity intensity. It is the ratio of energy expended in kilocalories, divided by the resting energy expenditure in kilocalories. A MET-minute is computed by multiplying the MET score of an activity by the minutes performed. MET-minute scores are equivalent to kilocalories for a 60 kilogram person (REF: IPAQ, 2005).

## Knowledge of Recreational Trails

Question: "Do you know of any walking, biking, or nature trails in Middlesex-London?" (Response options: yes; no; don’t know).

Use of Recreational Trails
Question: "Have you used any of these walking, biking, or nature trails in the last 12 months?" (Response options: yes; no; don't know).

Respondents who indicated no knowledge of recreational trails in Middlesex-London were not asked if they used the trails.

Highest level of Completed Education
Question: "What is the highest level of education you have obtained?"

- Less than high school: included those respondents who had not obtained a high school diploma.
- High school: included those respondents who had obtained a high school diploma or had completed some post-secondary education.
- Post secondary: included those respondents who had obtained a college diploma or university degree.

## Chapter 6: Healthy Eating

## Key Findings

- Just over one-third (35\%) of Middlesex-London adults reported eating at least 5 servings of fruit and vegetables per day in 2007.
- Women and those with a post-secondary education were more likely to consume at least 5 servings of fruit and vegetables per day than men and those with lower levels of education, respectively.
- Consumption of at least 5 daily servings of fruit and vegetables tended to increase with age.

## Progress on Meeting Public Health Objectives

Provincial Objective: Increase to $75 \%$ the proportion of the population age 4 years and older consuming 5 or more servings of vegetables and fruit daily by the year 2010.
区 Work needed*
The proportion has increased from $30.2 \%$ in 2001 to $35.1 \%$ in 2007. An additional $113 \%$ increase would be required to meet the objective for adults in 2010.
*Note: RRFSS data does not include participants younger than 18 years; thus, a direct evaluation of provincial objectives cannot be made.

## Fruit \& Vegetable Consumption

## Background

A large body of research indicates that the higher the consumption of fruits and vegetables, the lower the incidence of cardiovascular disease ${ }^{25,26}$. Fruit and vegetables contain a host of vitamins, minerals and phytochemicals such as vitamin C, potassium, flavonoids and carotenoids. In addition to supplying these beneficial nutrients, fruits and vegetables may change gut flora and increase roughage and fiber intake. Being low in calories, fruits and vegetables may simply displace the consumption of energy dense foods ${ }^{25}$.

One of the objectives of the Ontario Mandatory Health Programs and Service Guidelines, 1997 for MiddlesexLondon was to increase the proportion of individuals consuming five or more daily servings of fruits and vegetables to $75 \%$ by the year $2010^{6}$.

## Results

The proportion of Middlesex-London residents who ate at least 5 servings of fruit and vegetables per day increased from $30.2 \%( \pm 2.9 \%)$ in 2001 to $35.1 \%( \pm 2.7 \%)$ in 2007 ; however this difference was not statistically significant (Figure 6.1).

Figure 6.1: Fruit \& Vegetable Consumption
Adults 18+, Middlesex-London, 2001-2007

[^1]
## Sociodemographics

Significantly more females than males ate 5 or more servings of fruit and vegetables per day between 20012007. In 2007, $42.6 \%( \pm 3.8 \%)$ of females consumed $\geq 5$ servings/day compared to men ( $25.1 \% \pm 3.8 \%$ ) (Figure 6.2 ). The proportion of respondents consuming $\geq 5$ servings/day of fruits and vegetables tended to increase with age. Respondents aged $65+$ were significantly more likely to consume $\geq 5$ servings/day compared to younger age groups (Table 6.1). The proportion of respondents consuming $\geq 5$ servings/day of fruits and vegetables tended to increase with higher levels of completed education. In 2001, respondents with a post-secondary education were significantly more likely to consume $\geq 5$ servings/day compared to those who had not completed high school; however, this difference was not statistically significant in 2007 (Table 6.2).

## Eat Smart! Program

In 2007 the Eat Smart! Restaurant Program was discontinued in Middlesex-London due to limitations in local resources required to promote and maintain the program. Efforts were re-focused on promoting Eat Smart! Cafeterias in both schools and workplaces RRFSS tracking of local awareness and use of the Eat Smart! Designated restaurants was discontinued in 2004.

## Data and Methods

Data on fruit and vegetable consumption was from RRFSS between January and April and July and December, 2001 (waves 1 to 4; 7 to 12), 2002, January to August 2004 (waves 37 to 48), 2005 and 2007 (waves 49 to 60; 73-84). For each year of data collection, the unweighted samples of respondents from Middlesex-London are shown in Table 6.3. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents. The sample was weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars illustrating 95\% confidence intervals. Detailed tables for Chapter 6 are located in Appendix C6.

Table 6.3. Unweighted Sample Size for RRFSS Data on Fruit and Vegetable Consumption Adults 18+, Middlesex-London, 2001-2004

| Year | $2001^{*}$ | 2002 | $2004 * *$ | 2005 | 2007 |

## Definitions

Fruit and Vegetable Consumption:
The following questions were used to estimate the number of daily servings of fruits and vegetables.
Question: "How many times per day, week, or month do you drink $100 \%$ fruit juice such as orange, grapefruit or tomato juice?"
Question: "Not counting juice, how many times per day, week, or month do you eat fruit?"
Question: "How many times a day, week, or month do you eat a green salad?"
Question: "Not including French fries, fried potatoes or potato chips, how many times per day, week or month do you eat potatoes?"
Question: "What about carrots? How many times per day, week or month do you eat carrots?"
Question: "Not counting carrots, potatoes or green salad, how many times per day, week or month do you eat other vegetables?"

## Highest level of Completed Education

Question: "What is the highest level of education you have obtained?"

- Less than high school: included those respondents who had not obtained a high school diploma.
- High school: included those respondents who had obtained a high school diploma or had completed some post-secondary education.
- Post secondary: included those respondents who had obtained a college diploma or university degree.

## Chapter 7: Healthy Weights

## Key Findings

- Six out of every 10 adults (aged 20 to 64 years) in Middlesex-London were overweight or obese in 2007. This represents an increase of $20 \%$ since 2001.
- The proportion of adults ( 20 to 64 yrs ) who were overweight (BMI: 25-29) has risen by $15 \%$ from 2001 to $2007(36.1 \%$ to $41.6 \%$, respectively); the proportion who were obese (BMI: 30+) has risen more rapidly by $32 \%$ from $14.2 \%$ in 2001 to $18.7 \%$ in 2007.
- Although males were more likely to be overweight or obese than females, the rate of increase from 2001 to 2007 was greater for females than males.
- The proportion who were overweight or obese tended to increase with age.
- Although middle-age women (ages 35 to 64 ) were more likely to be overweight or obese than younger women, the proportion of younger women ages 20 to 34 who were overweight or obese rose at a significantly more rapid rate of $79 \%$ between 2001 and 2007 , from $19.6 \%$ to $35.1 \%$, respectively.
- Adults (ages 20 to 64) without a high school diploma were more likely to be overweight or obese compared to post-secondary school graduates. This gap in overweight/obesity rates between the higher and less well educated populations appears to have grown from 2001 to 2007.

## Progress on Meeting Public Health Objectives

Local Objective: Fewer than 30\% of adult males will be overweight (BMI >27) by March 2003.
区 Much work needed*
The objective has not been met. The proportion of men ages 20 to 64 who are overweight or obese (BMI $\geq 25$ ) has increased from $64.7 \%( \pm 4.3 \%)$ in 2001 to $72.0 \%( \pm 4.3 \%)$ in 2007. This trend needs to be reversed and the proportion decreased by $58 \%$ to meet the above target.
Local Objective: Fewer than 23\% of adult females will be overweight (BMI >27) by March 2003.
区 Much work needed*
The objective has not been met. The proportion of women ages 20 to 64 who are overweight or obese (BMI >25) has increased by $44 \%$ from $34.6 \%(+4.5 \%)$ in 2001 to $49.9 \%(+4.5 \%)$ in 2007. This trend needs to be reversed and the proportion decreased by $54 \%$ to meet the above target.

Provincial Objective: Slow the decrease in the proportion of adults ages 20-64 with healthy weight status by the year 2010.

## ® Much work needed

The objective has not been met. The proportion of adults with a healthy weight (BMI 18.5-24.9) declined from $47.4 \%( \pm 3.2 \%)$ in 2007 to $38.1 \%( \pm 3.2 \%)$ in 2001 , and more rapidly during the latter half of that time period.
*Note: Health Canada now defines overweight as BMI $\geq 25$ rather than $>27$ (7).

## Background

Excess body weight is associated with increased risk of heart disease, in addition to other health problems ${ }^{1,21}$. The Chief Medical Officer of Health Report in 2004 warned that an epidemic of overweight and obesity was threatening Ontario's health ${ }^{21}$. In the United States, poor diet and physical inactivity may soon overtake smoking as the leading cause of death ${ }^{27}$. Some have predicted that the current generation of children may be the first to have poorer health outcomes and a shorter lifespan than their parents ${ }^{28}$. Factors that may contribute to the obesity epidemic include obesogenic environments that discourage walking and biking through lack of sidewalks/bikepaths and require people to drive long distances to work ${ }^{21,29}$.

The Healthy Living Partnership Middlesex-London has a mandate to reduce the proportion of overweight male and non-pregnant female adults (20 to 64) to $30 \%$ and $23 \%$, respectively ${ }^{6}$. Rates of overweight and obesity were measured using the Body Mass Index (BMI). For more information, see the Data and Methods section for this chapter.

## Results: Body Mass Index

The proportion of respondents with a normal BMI declined significantly from $47.4 \%( \pm 3.2 \%)$ in 2001 to $38.1 \%$ $( \pm 3.2 \%)$ in 2007 (Figure 7.1). The proportion of respondents who were overweight or obese increased significantly from $50.2 \%( \pm 3.2 \%)$ in 2001 to $60.3 \% \pm 3.3 \%$ ) in 2007 (Figure 7.2).

Figure 7.2: Overweight or Obese BMI Among Females aged 20-64 Middlesex-London, 2001-2007

Original Data Source: MLHU RRFSS 2001-2007

## Sociodemographics

Although significantly more males than females had an overweight or obese BMI across all years, this difference narrowed from $30.1 \%$ in 2001 to $22.1 \%$ in 2007 (Figure 7.3 ). A significant increase in the proportion of respondents with an overweight or obese BMI was observed among females, but not males. The proportion of females who were overweight or obese increased from $34.6 \%( \pm 4.5 \%)$ in 2001 to $49.9 \%( \pm 4.5 \%)$ in 2007.

The likelihood of being overweight or obese increased with age. In 2007, the proportion of respondents with an overweight or obese BMI among those aged 20 to 24 was $39.7 \%( \pm 12.6 \%) ; 57.3 \%( \pm 5.0 \%)$ among those aged 25 to 44 , and $65.3 \%( \pm 4.3 \%)$ among those aged 45 to 64 (Figure 7.4). Compared to respondents aged 25 and older, respondents aged 18 to 24 were significantly less likely to be overweight or obese in all years except 2007.

Between 2001 and 2007, the proportion of respondents with an overweight or obese BMI increased significantly among females aged 35 to 64 , from $42.6 \%( \pm 5.8 \%)$ to $54.8 \%( \pm 5.1 \%)$ (Figure 7.5).

The proportion of respondents with a post-secondary education who were overweight/obese was lower compared to those with less than a high school education (Figure 7.6). This difference was $8.0 \%$ in 2001 and it increased to $19.7 \%$ in 2007. In 2007, the proportion of overweight/obese post-secondary graduates ( $55.7 \% \pm 4.3 \%$ ) was significantly lower than the proportion among those with less than a high school education ( $75.4 \% \pm 10.8 \%$ ).

## Data and Methods

Data on height and weight were from RRFSS 2001 to 2007 (waves 1 to 84). For each year of data collection, the unweighted sample of respondents from Middlesex-London is shown in Table 7.1. Those that did not respond to any individual question were excluded prior to calculating proportions, provided the non-response category represented $<5 \%$ of total respondents. The sample was weighted to account for each individual's probability of being selected within households of different sizes. Bar charts and line graphs include error bars illustrating $95 \%$ confidence intervals. Detailed tables for Chapter 7 are located in Appendix C7.

## Definitions

The Body Mass Index (BMI) is the most practical indicator of weight-related health risk for adult populations. It is not considered a valid measurement, however, for children, pregnant or lactating women and very muscular persons like athletes. Its validity is also questionable regarding the elderly. BMI is therefore calculated for those between the ages of 18 to 64 and excludes pregnant women. Those less than three feet ( 0.914 metres) tall or greater than 6 feet 11 inches ( 2.108 metres) are also excluded. It is calculated by dividing one's body weight in kilograms by the square of one's height in meters ( $\mathrm{kg} / \mathrm{m}^{2}$ ).

| Body Mass Index ${ }^{30}$ | Weight Category |
| :--- | :--- |
| $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Underweight |
| $18.5-24.9 \mathrm{~kg} / \mathrm{m}^{2}$ | Normal |
| $25.0-29.9 \mathrm{~kg} / \mathrm{m}^{2}$ | Overweight |
| $\geq 30.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Obese |

## Highest level of Completed Education

Question: "What is the highest level of education you have obtained?"

- Less than high school: included those respondents who had not obtained a high school diploma.
- High school: included those respondents who had obtained a high school diploma or had completed some postsecondary education.
- Post secondary: included those respondents who had obtained a college diploma or university degree.

Chapter 8：Summary of Progress Towards Meeting Healthy Living Objectives
This community health status report was undertaken by the Middlesex－London Health Unit，Research，Education，Evaluation and Development（REED）Services， for the Healthy Living Partnership Middlesex－London to measure the impact on population level changes in knowledge and behaviours related to heart disease in the Middlesex－London area．The Healthy Living Partnership Middlesex－London is a provincial initiative funded by the Ontario Heart Health Program（OHHP）， Ministry of Health Promotion．

The following chart is a summary of trends over time and progress towards meeting the Healthy Living objectives referred to throughout this report．Definitions to assess progress and their corresponding symbols are provided in the legend below．

| Healthy Living Objective | Trend Over Time |  |  |  | Objective Met？ | Notes |

## Appendix A. Data Source Descriptions

## Rapid Risk Factor Surveillance System (RRFSS)

Data sources for this report were primarily from the Rapid Risk Factor Surveillance System (RRFSS), which was conducted for the Middlesex-London Health Unit (MLHU) by the institute of Social Research, York University. Data were collected in a series of waves of monthly telephone surveys. Households were selected randomly from all households with telephones in London \& Middlesex and respondents 18 years and older were systematically selected from each household. Once an individual was identified as the person with the next birthday in the household, every effort was made to complete the interview with the appropriate respondent. Although on average 5 calls were made to a single household in order to complete the interview with the designated respondents in this survey, up to 14 call attempts was standard practice.

## Canadian Tobacco Use Monitoring Survey (CTUMS)

Data on youth smoking rates in Ontario were obtained from the Youth Smoking Survey collected as part of the Canadian Tobacco Use Monitoring Survey (CTUMS). CTUMS was initiated in 1999 to provide Health Canada with reliable data on tobacco use. The primary objective is to track changes in smoking status, particularly among those aged 15-24, who are most at risk for taking up smoking. Statistics Canada conducted computer-assisted interviews by telephone between February and December, annually. Only direct reports (i.e., not third party) with selected persons were accepted. To allow provincial comparisons of approximately equal reliability, the overall sample size for the survey was divided equally across all 10 Canadian provinces (residents of Yukon, Nunavut, and the Northwest Territories, full-time residents of institutions were excluded). Every telephone number called by Statistics Canada was fully accounted for in order to properly weight the data to represent the Canadian population.

## Canadian Community Health Survey (CCHS)

Data on youth smoking in the Middlesex-London area was obtained from the Canadian Community Health Survey (CCHS) in 2000/01, 2003, and 2005. The survey collected information by telephone from individuals 12 and older in the Middlesex-London area (residents of First Nations reserves, Canadian Forces Bases, and some remote areas were excluded)

## Appendix B. Analysis Notes

Given that RRFSS uses random household surveys, weights were applied to account for each respondent's probability of being selected within households of different sizes. Designated respondents who refused to respond to individual questions within each of the sections were excluded prior to calculating proportions provided the refusal category represented less than $5 \%$ of the total respondents. Non-responders for descriptive or demographic variables were excluded in each individual table prior to calculation of percentages. However, non-responses to individual questions were included in the calculation of the proportion if non-response was larger than $5 \%$. Results were considered unstable and subject to suppression if any of the following conditions existed: denominator of a rate $<30$, numerator $<5$, or coefficient of variation >33.3.

## Confidence intervals

Confidence intervals are provided to indicate the precision of an estimate. The narrower the confidence interval is, the more precise is the estimate; conversely, the wider the interval, the less precise the estimate. Ninety-five percent confidence intervals represent the range within which the true proportion should occur 95 times out of 100 . In other words, we can be $95 \%$ confident that the true proportion lies within the lower and upper limits of the confidence interval. The difference between two proportions is said to be 'statistically significant' and not likely due to chance alone when their respective confidence intervals do not overlap.

## Representativeness of RRFSS sample

The representativeness of a survey sample refers to how similar the sample is to the population it is meant to represent. If a demographic group is over or under-represented in a sample, then the overall prevalence estimates of related variables (eg smoking status) may be biased. Stratifying on these demographic variables provides information with regards to the direction of bias. For example, if current smoking status is more likely among participants with lower levels of education, and the sample is underrepresented with respect to this demographic group then the overall estimate of smoking prevalence will be underestimated.

One method of assessing representativeness is to compare the distribution of demographic variables to available Canada Census figures for the same geographic region. Compared to Census figures, the 2006 RRFSS sample slightly overrepresented females and adults between the ages of 45 and 64, and slightly under-represented males and those with a high school diploma or less as the highest level of education completed. The 2001 RRFSS sample over-represented adults between the ages of 20 to 24 and under-represented adults ages 65 and older as well as those with a high school diploma or less education.
